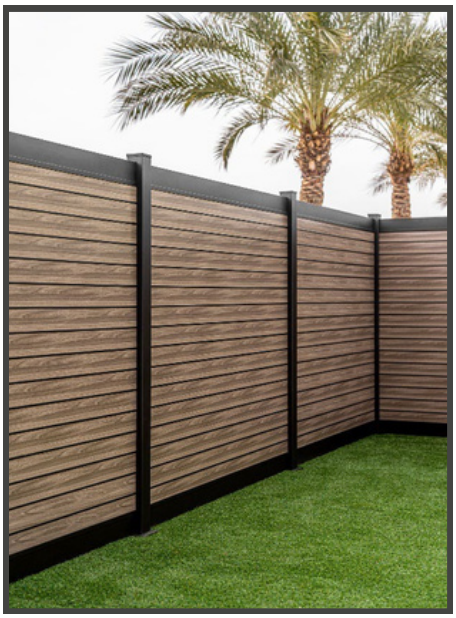
# CLEANING INSTRUCTIONS OF PrimeAlux FENCE SYSTEM

To keep PrimeAlux fence system **AFS** durable and attractive for years, certain cleaning tips will help to keep it in mint condition. Cleaning removes dirt and stains from products surface to maintain the aesthetic appearance of the coating. When PrimeAlux fence system is near salt water or highly polluted areas, accumulated stain may result on the coatings surface and cause the finish to may gradually fade. This may accelerate degradation of the coating's surface through corrosion and will reduce the coating's years of service



Documented cleaning is required twice per year, the frequency of cleaning must be increased in more extreme weather conditions. Avoid cleaning of AFS when temperature is more than 30˚C/ 86˚F

The cleaning process of aluminum fence system is quick and easy, the following points has to be considered while cleaning:

1- Rinse down your fence

The best way to begin is by thoroughly rinsing your fence down with a garden hose. Make sure to rinse away all the soil, leaves, and debris. Keeping the fence wet with a light drizzle of water, or washing in the early evening will prevent spots from forming. It's also important to rinse with an indirect spray instead of a jet blast of water.

- Do not use jet water or high-water pressure,
- Do not wash in direct sunlight, If the metal is hot, the water, and even the soap, will dry up quickly because of the sun, which will leave spots on the surface.

2- Use a soft microfiber cloth

A microfiber drying towel is softer and more absorbent than other household towels, which will protect your finish from scratches and dry your fence quicker.

- Do not use sponge to wipe away any remaining dirt, dust, or other matter,
- Do not rub the profiles too hard as you'll scratch the finish,
- Do not use Household towels made of polyester, they are simply too abrasive to be safely used on your fence surface.

3- Start at the bottom

Start at the bottom and work your way up. This is important because you don't want to collect dirty run-off water along the way. As you move up, you'll notice that the finish begins to look streaky. To fix this problem, simply mix your non-abrasives cleaner in water and apply it to the entire fence. Wait about 30 seconds and then continue moving upward.
